- Industrial-Safety-Module-4-Important-Topics-PYQs
  - 1. Mention any four potential hazards associated with wire rope used for material handling.
  - 2. Discuss the key elements of a hearing conservation program.
    - Key Parts of a Hearing Conservation Program:
  - 3. Explain the safety guidelines to be followed for the lifting hooks used in heavy industrial mechanisms.
    - Inspection and Maintenance
    - Proper Usage
  - 4. What are the various objectives of Maintenance?
    - 1. Ensuring Equipment Reliability
    - 2. Prolonging Equipment Life
    - 3. Safety and Compliance
    - 4. Cost Control
    - 5. Improving Productivity
  - 5. List the safety precautions to be followed during grinding operations.
    - 1. Use of Protective Equipment
    - 2. Inspection and Maintenance
    - 3. Machine Setup and Operation
    - 4. Workplace Safety
    - 5. Handling and Usage
    - 6. Emergency Preparedness
  - 6. Mention the various safety considerations in material handling.
  - 7. What are the objectives of machinery safeguards?
  - 8. Explain the operation of any two types of safety guards suitable for industrial applications.

- 1. Fixed Guards
  - 2. Interlocked Guards
  - 3. Adjustable Guards
  - 4. Self-Adjusting Guards
- 
- 9. Explain the potential hazards associated with grinding operations.
  - 10. Discuss the safety issues associated with gas welding operations.
    - 1. Personal Protective Equipment (PPE):
    - 2. Storage and Handling Safety:
    - 3. Environmental Safety:
    - 4. Operation and Equipment Safety:
  - 11. Discuss the handling capacity assessment for lifting processes associated with manual material handling.
    - 1. Risk Assessment for Manual Handling
    - 2. Guidelines for Lifting Capacity
    - 3. Factors Affecting Lifting and Handling Capacity
    - 4. Pushing and Pulling
    - 5. When to Perform a Detailed Assessment
    - 6. Documentation and Action Plans
  - 12. Describe the safety practices to be followed during arc welding processes.
    - 1. Welding Tools & Equipment Safety
    - 2. Personal Safety
    - 3. Recommended Welding Safety Gear
    - 4. Other Important Considerations
  - 13. Differentiate between manual and mechanized material handling with suitable examples.
    - 1. Manual Material Handling
    - 2. Mechanized Material Handling
      - Key Differences:
  - 14. An industrial plant is equipped with cranes, conveyors, hoists, etc. Explain the maintenance strategy to be followed for any of the material handling equipment to ensure a safe working environment.
    - 1. Maintenance for Hoists and Cranes
      - (a) Inspection
      - (b) Repairs
      - (c) Overhaul

- 2. Maintenance for Conveyors
  - (a) Inspection
  - (b) Repairs
  - (c) Overhaul
- 15. With suitable schematics, explain the operation of any presence-sensing device suitable as a safety guarding device for an industrial unit.
  - 1. Photoelectric Presence-Sensing Device
    - Working Principle:
    - Example of Application:
  - 2. Electromechanical Sensing Device
    - Working Principle:
    - Example of Application:
  - Comparison of Photoelectric vs Electromechanical Presence-Sensing Devices
- 16. Briefly explain the maintenance of chain slings.
  - 1. Routine Inspections
  - 2. Wear Limits
  - 3. Overload Protection
  - 4. Proper Storage
  - 5. Handling and Environmental Considerations
  - 6. Temperature Range
- 17. Briefly explain the maintenance of clamps.
  - 1. Cleaning
  - 2. Lubrication
  - 3. Proper Storage
- 18. What are the different types of machine guarding devices used in industries? Discuss the suitability of each.
  - 1. Fixed Guards
  - 2. Interlocked Guards
  - 3. Adjustable Guards
  - 4. Self-Adjusting Guards
  - 5. Two-Hand Control Devices
  - 6. Presence-Sensing Devices
  - 7. Pullback and Restraint Devices
  - 8. Automatic and Semi-Automatic Feeding/Ejection Devices

- 19. Safety in turning, welding
  - Safety in Turning (Lathe Work)
  - Safety in Gas Welding
  - Safety in Arc Welding

## ***1. Mention any four potential hazards associated with wire rope used for material handling.***

### **1. Abrasion and Wear**

- Prolonged use of wire rope can lead to wear and abrasion, reducing its strength and potentially causing it to fail during operation.

### **2. Overloading**

- Exceeding the safe working load of the wire rope can result in snapping, posing a serious risk to workers and equipment.

### **3. Corrosion**

- Exposure to moisture or chemicals can cause wire ropes to corrode, compromising their load-bearing capacity and increasing the risk of accidents.

### **4. Improper Handling and Maintenance**

- Mishandling, such as using incorrect tools or not conducting regular inspections, can lead to kinks, fraying, or breakage of the wire rope.

### **Trick to learn**

In a busy warehouse, a worker was operating a crane to lift heavy materials. The wire rope, worn from years of use, showed signs of **abrasion and wear**, but no one had noticed. One day, as the crane hoisted a load that exceeded the rope's capacity, it snapped with a loud crack. The rope had been weakened by **corrosion** from exposure to moisture and chemicals, and the regular **improper handling** during use hadn't helped either. The accident could have been prevented with better **maintenance**.

## ***2. Discuss the key elements of a hearing conservation program.***

A **Hearing Conservation Program (HCP)** is a plan put in place to protect workers from losing their hearing due to loud noises in the workplace. It involves monitoring noise levels, testing

workers' hearing, providing protective gear, and educating employees on how to protect their ears.

## Key Parts of a Hearing Conservation Program:

### 1. Noise Monitoring:

- **Area Monitoring:** Measure the noise levels in the workplace with a sound meter.
- **Personal Monitoring:** A worker wears a microphone near their ear to measure the exact noise they're exposed to all day.

### 2. Hearing Tests (Audiometric Testing):

- All employees in the program must get their hearing tested every year in a quiet environment to check for any hearing loss.

### 3. Hearing Protection:

- Employers provide different types of ear protection (like earplugs) to match the noise levels. Workers are tested to make sure the protection fits properly.

### 4. Training and Education:

- Employees are taught about the effects of noise, how to use hearing protection, and the details of the hearing conservation program.

### 5. Record Keeping:

- Employers keep records of workers' hearing tests, training, and other related documents to track any changes in hearing over time.

### 6. Program Evaluation:

- The program is regularly reviewed to ensure it's working well by asking for feedback and checking records.

## Trick to learn

At a busy factory, workers were exposed to high noise levels every day. To protect their hearing, the company implemented a **Hearing Conservation Program**. First, they began **noise monitoring**, measuring both area and personal noise exposure. Every year, employees underwent **audiometric testing** to track any hearing loss. Workers were provided with proper **hearing protection**, and each person received training on how to use it correctly. The company kept detailed **records** of hearing tests and training. To ensure the program was effective, regular **evaluations** were done, making sure everyone's hearing stayed safe in the noisy environment.

### ***3. Explain the safety guidelines to be followed for the lifting hooks used in heavy industrial mechanisms.***

#### **Inspection and Maintenance**

##### **1. Routine Inspection:**

- Inspect hooks before each use
- Remove the hook from service if any of the following issues are present:
  - **Cracks, Nicks, or Gouges:** Signs of damage compromise the hook's strength.
  - **Excessive Twist:** Hooks twisted more than **10 degrees** from the original plane.
  - **Wear and Tear:** Loss of material exceeding **10%** of the original dimensions.
  - **Heat Damage:** Exposure to heat that may weaken the hook.
  - **Unauthorized Repairs:** Hooks altered or repaired without manufacturer approval.

##### **2. Repair Practices:**

- Minor cracks or nicks should only be removed by a qualified technician.
- Repairs must not result in a loss of more than **10% of the original dimensions**.
- Avoid reshaping, welding, heating, or burning unless approved by the hook manufacturer.

#### **Proper Usage**

##### **1. Load Placement:**

- Always seat the lifting device (sling, chain, or rope) properly in the **bowl of the hook**.
- Do not rely on the latch to support the load.

##### **2. Avoid Improper Loading:**

- **Side Loading:** Do not apply loads to the side of the hook as it weakens the structure.
- **Back Loading:** Avoid loading the hook in reverse.
- **Point Loading:** Never concentrate the load on the hook's tip, which reduces its capacity significantly (up to **60%**).

### ***4. What are the various objectives of Maintenance?***

#### **1. Ensuring Equipment Reliability**

- Minimize equipment downtime by addressing potential failures proactively.
- Enhance the reliability of machinery and tools to meet production demands.
- Ensure continuous operation by preventing sudden breakdowns.

## 2. Prolonging Equipment Life

- Reduce wear and tear through routine maintenance and timely repairs.
- Extend the lifespan of equipment by maintaining its optimal operating condition.
- Prevent deterioration caused by environmental factors like corrosion or heat.

## 3. Safety and Compliance

- Ensure workplace safety by keeping equipment in a safe and functional state.
- Comply with industry standards, legal requirements, and safety regulations.
- Minimize risks of accidents caused by malfunctioning machinery.

## 4. Cost Control

- Reduce repair costs by identifying and fixing minor issues before they escalate.
- Lower operational costs by avoiding unplanned downtime and emergency repairs.
- Minimize production losses due to unexpected breakdowns.

## 5. Improving Productivity

- Ensure uninterrupted operations to meet production schedules.
- Optimize the availability of resources and machinery for higher productivity.
- Reduce delays caused by equipment failures or inefficiencies.

## Trick

- Consider a car
- More you maintain a car, more reliable, it won't break down
- Even if you use a well-maintained car too much, it will have a prolonged life
- Driving a well-maintained car is safe
- Less cost
- More productivity, will give more mileage per petrol

## ***5. List the safety precautions to be followed during grinding operations.***

### **1. Use of Protective Equipment**

- Always wear safety glasses or goggles, and a face shield to protect against flying particles.
- Use gloves, aprons, metatarsal safety boots, hearing protection, and respiratory protection as necessary.

### **2. Inspection and Maintenance**

- Inspect grinding wheels for cracks or damage before use; do not use defective wheels.
- Regularly clean and service grinders as per the manufacturer's recommendations.
- Ensure the grinder and wheel are within their maximum rated speed limits.
- Keep a record of all maintenance activities.

### **3. Machine Setup and Operation**

- Install and properly adjust wheel guards according to the manufacturer's manual.
- Ensure the grinder is fitted with the correct abrasive wheel for the material and task.
- Verify the grinder will not operate when left unattended.
- Do not operate the grinder on a wet surface or in a damp environment.

### **4. Workplace Safety**

- Keep the work area clean and free of flammable materials to prevent fire hazards.
- Ensure combustible dust does not accumulate in the workspace.
- Keep the power cord away from the wheel and the material being ground.

### **5. Handling and Usage**

- Do not use wheels that vibrate excessively.
- Never adjust the workpiece or mounting devices while the machine is running.
- Do not exceed the recommended depth of cut for the wheel or the grinder.
- Always remove the workpiece from the grinding wheel before turning the machine off.

### **6. Emergency Preparedness**

- Keep a fire extinguisher accessible in case of sparks igniting nearby materials.
- Know the emergency stop procedure for the grinder.

### Trick

- Suppose we are doing grinding work
- Wear PPE kit
- Check the equipment for problem
- Adjust the equipment
- Clean the area of any flammable material
- Handle carefully
- Emergency-fire extinguisher

## ***6. Mention the various safety considerations in material handling.***

### **1. Lifting Practices**

- Avoid lifting materials from the floor or while seated.
- Begin lifts close to the body and keep them between shoulder and knuckle height.
- Do not twist or bend while lifting.

### **2. Use of Equipment**

- Utilize handling aids like conveyors, slides, or chutes.
- Use containers made of lighter materials and reduce load sizes when possible.

### **3. Work Environment**

- Ensure areas have adequate footing, space, and lighting.
- Avoid lifting over obstacles or in cluttered spaces.

### **4. Safe Movements**

- Avoid sudden or jerky movements.
- Eliminate pushing or pulling by using mechanical aids where possible.

### **5. Teamwork and Ergonomics**

- Seek assistance from co-workers for heavy or bulky items.
- Redesign tasks and modify objects to make movement easier.

### **6. Health and Fitness**

- Stay in good physical shape to handle materials safely.
- Avoid repetitive or excessive heavy lifts to reduce strain.

### Trick

- Suppose we have to lift cupboards from a truck to a room
- We will be lifting the cupboard from the back of the truck rather than from ground
  - if possible we can use conveyor slides
- Since the cupboard there will be lot of people, we need lot of space and lighting to transport
- When transporting, we need avoid sudden movements
- We will be seeking assistance from others to lift this
- To lift such stuff we need to be in good physical shape

## 7. *What are the objectives of machinery safeguards?*

### 1. **Prevent Contact:**

Protect workers from coming into contact with hazardous moving parts or points of operation.

### 2. **Secure Safeguards:**

Ensure guards are durable, tamper-proof, and firmly attached to machines to prevent accidental removal.

### 3. **Prevent Falling Objects:**

Stop objects from falling into moving parts, avoiding potential projectiles and injuries.

### 4. **Avoid New Hazards:**

Safeguards should not introduce sharp edges, pinch points, or other hazards during installation or use.

### 5. **Minimize Interference:**

Allow workers to perform tasks efficiently without removing or bypassing safeguards.

## 8. *Explain the operation of any two types of safety guards suitable for industrial applications.*

**Guards** are safety devices designed to protect workers from hazardous machine parts by blocking or limiting access. Here's a simple explanation of the four main types:

## 1. Fixed Guards

- **What they are:** Fixed guards are permanent barriers attached to a machine and have no moving parts. They can't be adjusted or moved while the machine is operating.
- **How they work:** They fully cover dangerous areas like blades or fan parts, preventing any accidental contact.
- **Example:** A metal cover over a saw blade.
- **Benefits:** Simple, reliable, and sturdy.
- **Downside:** They need to be removed for machine adjustments or maintenance.

## 2. Interlocked Guards

- **What they are:** Interlocked guards shut off the machine's power when opened or removed.
- **How they work:** If the guard is moved while the machine is running, the power source is disengaged, stopping the machine.
- **Example:** A cover that shuts down a conveyor belt when lifted.
- **Benefits:** Allows quick access to machine parts safely.
- **Downside:** Can be accidentally opened, so they require careful maintenance.

## 3. Adjustable Guards

- **What they are:** Adjustable guards can be manually moved or resized to fit different sizes of materials being processed by the machine.
- **How they work:** The operator adjusts the guard to create a safe distance between the moving parts and themselves.
- **Example:** A saw guard that can be adjusted for different wood thicknesses.
- **Benefits:** Flexible and useful for handling different materials.
- **Downside:** Needs to be properly adjusted to avoid accidents.

## 4. Self-Adjusting Guards

- **What they are:** Self-adjusting guards automatically move to accommodate the size of the material being processed.

- **How they work:** When the machine is not in use, the guard covers the dangerous parts. When the material is fed into the machine, the guard automatically opens just enough to let the material pass through.
- **Example:** A table saw guard that lifts when wood is fed through.
- **Benefits:** Automatically adjusts, no manual setup needed.
- **Downside:** May not provide complete protection in all situations.

## 9. *Explain the potential hazards associated with grinding operations.*

- **Flying Particles and Dust:**
  - Grinding generates flying debris, sparks, and dust that can injure the operator's eyes or skin.
  - Prolonged exposure to dust can lead to respiratory issues.
- **Abrasive Wheel Breakage:**
  - Abrasive wheels can shatter during use due to excessive pressure, improper mounting, or defects, causing severe injuries.
- **Entanglement:**
  - Loose clothing, jewelry, or hair can become entangled in the moving parts of the grinder.
- **Fire and Explosion Risks:**
  - Sparks from grinding can ignite nearby flammable materials or combustible dust.
- **Electric Shock:**
  - Operating grinders on wet surfaces or with damaged cords can cause electric shocks.
- **Noise and Vibration:**
  - Prolonged exposure to noise and vibration can lead to hearing loss or hand-arm vibration syndrome (HAVS).
- **Improper Operation:**
  - Using incorrect speeds, damaged wheels, or excessive force can compromise safety.

## 10. Discuss the safety issues associated with gas welding operations.

### 1. Personal Protective Equipment (PPE):

- **Eye Protection:** Use goggles or safety glasses to shield eyes from infrared radiation and sparks.
- **Protective Clothing:** Wear flame-resistant aprons, gloves, helmets, long-sleeved shirts, and trousers. Ensure clothing is free from oil or grease and is well-fitted.
- **Footwear:** Use flame-resistant boots to prevent injuries from sparks or hot debris.

### 2. Storage and Handling Safety:

- **Cylinder Handling:**
  - Store cylinders upright and secure them with chains to prevent falling.
  - Keep acetylene and oxygen cylinders separated and in a well-ventilated area.
  - Avoid dragging cylinders; roll them gently on their bottom edges.
- **Valves and Regulators:**
  - Close valves when cylinders are not in use or being moved.
  - Keep protective caps in place.
  - Avoid handling valves with oily or greasy hands.

### 3. Environmental Safety:

- Ensure proper ventilation to prevent gas accumulation.
- Maintain clean floors free from water, oil, or grease to reduce slipping hazards.
- Install accessible fire extinguishers and display safety posters.
- Provide clear escape routes and walkways.

### 4. Operation and Equipment Safety:

- **Flame Arrestors:** Fit flame arrestors on acetylene and oxygen lines to prevent backflow of gas and potential explosions.
- **Pressure Regulation:** Use oxygen at higher pressure than acetylene. Avoid using acetylene at pressures exceeding 1 bar.
- **Backfire or Flashback:**
  - Close the oxygen valve first, followed by acetylene, in case of backfire.

- Replace hoses after a flashback, as they may become damaged.
- **Welding Flame Control:** Ensure proper adjustment of flame to avoid accidental ignition.

## ***11. Discuss the handling capacity assessment for lifting processes associated with manual material handling.***

### **1. Risk Assessment for Manual Handling**

A manual handling risk assessment identifies hazardous tasks and suggests control measures to prevent injuries. The assessment should account for the following:

- **Load:** The characteristics of the load being handled (e.g., weight, shape, stability).
- **Individual:** The physical capabilities of the worker (e.g., strength, age, health).
- **Task:** The specifics of the task (e.g., lifting, pushing, pulling, posture, distance, repetition).
- **Environment:** The working conditions (e.g., space, flooring, temperature, lighting, PPE requirements).

Regular assessments are required, especially when there are changes in the environment, equipment, or procedures that may introduce new hazards.

### **2. Guidelines for Lifting Capacity**

The guidelines for lifting and lowering weights are based on a worker's hand positions during the task. As per the Health and Safety Executive (HSE), the following should be considered:

- **Weight Limits Based on Hand Position:** The lifting capacity decreases if the load is handled at higher or lower levels or with arms extended, as these positions increase the risk of injury.
- **Lifting Frequency:** If lifting occurs frequently (e.g., more than 30 times per hour), the guideline weight should be reduced:
  - **30% reduction** if lifting occurs 1-2 times per minute.
  - **50% reduction** for 5-8 lifts per minute.
  - **80% reduction** for more than 12 lifts per minute.

### **3. Factors Affecting Lifting and Handling Capacity**

The following are crucial when assessing lifting capacity:

- **Load Characteristics:** Heavier, bulkier, or difficult-to-grasp loads should have lower weight limits. Additionally, unstable or sharp loads increase the risk of injury.
- **Posture and Reach:** Lifting at awkward angles, such as lifting above head height or below floor level, increases the strain on the body and should be avoided or carefully monitored.
- **Task Complexity:** Tasks involving repetitive movements, twisting of the torso, or team handling require more careful assessment, as these increase physical strain and the potential for injury.
- **Handling Equipment:** If the load is difficult to handle manually, the use of lifting aids or machinery should be considered.

#### 4. Pushing and Pulling

Guidelines for pushing and pulling include:

- **Force to Start or Stop the Load:**
  - **Men:** 20 kg
  - **Women:** 15 kg
- **Sustained Force to Keep the Load in Motion:**
  - **Men:** 10 kg
  - **Women:** 7 kg

#### 5. When to Perform a Detailed Assessment

A full, detailed assessment should be conducted if:

- Lifting involves large forward reaches, or occurs above head height or below floor level.
- The load is frequently handled (more than once every two minutes).
- The task involves torso twisting or team handling.
- The load is difficult to grasp or handle.
- Working conditions are unfavorable (e.g., poor lighting or slippery floors).
- The worker cannot keep the load close to the body while carrying.

#### 6. Documentation and Action Plans

- **Recording Findings:** All risk assessments should be documented, especially if the organization has more than five employees. The assessment should be used for reference or training purposes.

- **Action Plan:** Based on the findings, identify actions to reduce risk to an acceptable level. These actions should be assigned to specific individuals, with a timeline for completion.
- **Approval and Review:** Once the assessment is completed, it should be approved by a supervisor. Reviews should be conducted regularly or after incidents, with a focus on higher-risk activities.

### Trick to learn

In a bustling warehouse, the safety team faced the challenge of improving manual material handling. They started with a **risk assessment**, evaluating loads, worker abilities, tasks, and the environment. They established **lifting guidelines**, reducing weight limits for awkward positions or repetitive tasks. For pushing and pulling, they set clear force limits to prevent strain.

When handling heavy or unstable loads, they recommended lifting aids and proper posture to minimize risks. Detailed assessments were performed for frequent lifts or tough conditions, with all findings **documented**. By creating an **action plan**, assigning tasks, and reviewing regularly, they ensured a safer workplace for all.

## 12. Describe the safety practices to be followed during arc welding processes.

### 1. Welding Tools & Equipment Safety

- **Grounding:** Ensure that all welding machines are properly grounded. A good ground connection is essential to prevent electrical shocks or sparks.
- **Electrode Holder Insulation:** Always ensure the electrode holder is properly insulated to prevent accidental electrical shock.
- **Electrical Safety:** Faulty equipment can lead to short circuits or electric shock hazards.
- **Avoid Overloading:** Do not overload the welding machine, as it can cause overheating and potentially lead to equipment failure or fire.
- **Machine Maintenance:** If you hear any abnormal sounds from the machine, call a qualified expert to inspect and rectify the issue. Regular maintenance is critical to prevent accidents.

### 2. Personal Safety

- **Eye Protection:** Protect your eyes from harmful radiation, such as infrared rays, ultraviolet light, and flying sparks. These can cause serious damage to the eyes and skin.
  - **Welding Helmet:** A welding helmet with a special filter glass must be worn to protect against infrared and ultraviolet radiation, as well as flying debris.
- **Clothing Protection:** Wear appropriate protective clothing, such as:
  - **Leather Apron:** Protects against sparks and molten slag.
  - **Leather Gloves:** Protects hands from burns and electrical shock.
  - **Leg Guards:** Protects legs from heat and sparks.
  - **Safety Boots:** Must be sturdy, made of leather, and heat-resistant to protect against sparks and hot metal.
- **Protection from Fumes and Gases:** Welding produces fumes and gases that can be toxic. Always ensure good ventilation or use appropriate respirators to avoid inhaling harmful substances.
- **Health Protection:** Be aware of the health risks associated with welding, including respiratory issues, and ensure proper ventilation in the work area.

### 3. Recommended Welding Safety Gear

- **Ear Protection:** Wear earplugs or earmuffs to protect against high noise levels that can lead to hearing loss over time.
- **Welding Helmet:** A helmet with a cover plate that provides protection against ultraviolet and infrared light. The opacity of the cover plate should be selected based on the material being welded.
- **Respirators:** Use respirators if you are exposed to toxic fumes or gases.
- **Wet Clothing:** Never operate a welding machine if any of your clothing is wet, as this increases the risk of electrical shock.

### 4. Other Important Considerations

- **Avoid Welding with a Pacemaker:** If you have a pacemaker, avoid operating welding equipment, as the electromagnetic field can interfere with the pacemaker's function.
- **Regular Training and Awareness:** All welders should be trained in safety procedures and be made aware of potential hazards in their work environment.

## 13. Differentiate between manual and mechanized material handling with suitable examples.

### 1. Manual Material Handling

Manual material handling involves the physical movement of materials by workers without the use of machinery or mechanical devices. It often includes tasks such as lifting, carrying, pushing, pulling, and stacking by hand.

- **Examples:**
  - **Lifting boxes manually:** Workers lifting boxes or containers by hand to transport them.
  - **Carrying items over short distances:** Workers manually transporting goods from one location to another in a warehouse or factory.
  - **Stacking materials:** Workers arranging materials or products on shelves or pallets without the use of automated systems.
- **Advantages:**
  - Low initial investment as it does not require complex machinery.
  - Flexible and suitable for small-scale operations.
  - Easy to perform in tight spaces or areas where machines cannot operate.
- **Risks:**
  - Manual handling can lead to musculoskeletal injuries, such as back strains, sprains, and repetitive strain injuries.
  - Fatigue and strain on workers, especially when handling heavy or awkward loads.
  - Higher risk of accidents due to human error or fatigue.
- **Risk Assessment:** Organisations must conduct manual handling risk assessments to identify tasks that could be hazardous, considering factors like load weight, the worker's physical capabilities, and environmental conditions (e.g., space, lighting, flooring). Control measures or equipment should be put in place to reduce risks.

### 2. Mechanized Material Handling

Mechanized material handling involves the use of machines or automated systems to move, store, or transport materials. It includes the use of tools such as cranes, conveyors, forklifts, palletizers, and hoists.

- **Examples:**

- **Forklifts:** Used for lifting and transporting heavy materials across factory floors or warehouses.
- **Conveyors:** Automated systems used to transport items between different stages of production or storage.
- **Cranes and Hoists:** Used for lifting and moving large, heavy objects, especially in construction or manufacturing industries.
- **Palletizers:** Machines that arrange products onto pallets for easy transport and storage.
- **Advantages:**
  - Increases productivity and efficiency by reducing manual labor.
  - Reduces human fatigue and minimizes the risk of worker injury.
  - Capable of handling heavier, bulkier, or more dangerous materials.
  - Machines can perform repetitive tasks quickly and with high precision.
- **Risks:**
  - Requires skilled operators to ensure safe use of machines, preventing accidents and damage.
  - Machinery can malfunction or cause accidents if not properly maintained or inspected.
  - High initial investment and ongoing maintenance costs.
- **Maintenance and Safety:** To prevent accidents, mechanical handling tools and machines must undergo regular inspection and preventive maintenance. For example, all lifting machines (such as forklifts) must have a valid OSHA inspection certificate. Machine operators should be trained to recognize potential hazards and adhere to safety guidelines.

## Key Differences:

Aspect	Manual Material Handling	Mechanized Material Handling
Method	Physical labor by workers	Use of machines and tools for material movement
Examples	Lifting, carrying, stacking by hand	Forklifts, cranes, conveyors, palletizers
Advantages	Low initial cost, flexible, simple tasks	Increased productivity, reduced risk of injury, handles heavy loads

Aspect	Manual Material Handling	Mechanized Material Handling
<b>Risks</b>	Physical strain, fatigue, injury	Machinery malfunction, need for skilled operators, high initial cost
<b>Maintenance</b>	Minimal maintenance required	Regular maintenance and inspections required
<b>Suitability</b>	Small-scale operations, lighter materials	Large-scale operations, heavy or bulky materials
<b>Health and Safety Risks</b>	Musculoskeletal disorders, fatigue	Operator safety, machine malfunctions, certification issues

**14. An industrial plant is equipped with cranes, conveyors, hoists, etc. Explain the maintenance strategy to be followed for any of the material handling equipment to ensure a safe working environment.**

## 1. Maintenance for Hoists and Cranes

### (a) Inspection

- **Routine Inspections:** All components of hoists and cranes, including both visible and covered parts, should be thoroughly inspected for any signs of wear, damage, or malfunction.
- **Focus Areas:**
  - **Wire Ropes:** Check for fraying, broken wires, and overall wear.
  - **Wheels and Bearings:** Look for signs of wear, misalignment, or damage.
  - **Bolts and Fasteners:** Inspect for loosening or corrosion.
  - **Brakes:** Ensure they are functioning properly by checking for wear on brake pads and verifying the brake mechanism.
  - **Lubrication:** Ensure that all moving parts, such as gears, bearings, and chains, are adequately lubricated to prevent friction and wear.

### (b) Repairs

- **Minor Repairs:** If defects or wear are detected during inspection, minor repairs should be carried out promptly. This includes:

- Replacing worn-out wire ropes and bearings.
- Adjusting or replacing brake components.
- Tightening or replacing bolts and fasteners.
- **Systems to Repair:**
  - Open gear transmission systems.
  - Trolley and coupling adjustments.
  - Riveted or bolted joints.
  - Safety guards, such as those preventing accidental contact with moving parts.

### (c) Overhaul

- **Complete Overhaul:** Periodic overhauling is required to ensure that the hoist or crane remains in good working condition. This includes:
  - **Dismantling the Entire Mechanism:** The equipment should be taken apart to inspect each part individually.
  - **Replacement of Damaged Parts:** Replace all worn-out or damaged components, including crane structure, buffers, rails, open gear transmission, pulley blocks, and other sub-mechanisms.
  - **Alignment and Adjustment:** All parts should be properly aligned and adjusted for optimal operation, including the crane's rails and structural components.

## 2. Maintenance for Conveyors

### (a) Inspection

- **Routine Checks:** Regular inspection of the conveyor system should be conducted to identify any signs of damage, wear, or misalignment.
- **Focus Areas:**
  - **Belts and Rollers:** Check the tension, condition, and alignment of the conveyor belts and rollers.
  - **Gearbox Lubrication:** Ensure the gearbox is properly lubricated to avoid overheating and wear.
  - **Safety Guards:** Check that all safety guards are in place and functioning to prevent accidents.
  - **Fasteners and Joints:** Tighten any loose fasteners and inspect joints for stability.

### (b) Repairs

- **Minor Repairs:** Components that are showing signs of wear or malfunction should be promptly repaired:
  - **Belts and Rollers:** Adjust or replace any belts and rollers that show signs of wear or misalignment.
  - **Couplings and Bearings:** Inspect for damage or wear, and replace or lubricate as needed.
  - **Safety Guards:** Ensure that all guards are intact and functioning to protect workers from moving parts.
  - **Structural Components:** Inspect the steel structures and ensure that they are secure, adjusting or repairing as needed.
  - **Gear Transmission:** Check for wear and tear and repair any damaged gears.

### (c) Overhaul

- **Complete Overhaul:** A more thorough overhaul of the conveyor system is necessary after extensive use or when significant wear is noticed.
  - **Dismantling:** Completely dismantle the system to inspect all components.
  - **Replacement of Worn Components:** Replace worn-out or irreparable components like belts, bearings, rollers, drums, oil seals, and fasteners.
  - **Repairs to Structure and Guards:** Repair or replace any damaged structural components or safety guards.

## ***15. With suitable schematics, explain the operation of any presence-sensing device suitable as a safety guarding device for an industrial unit.***

### **1. Photoelectric Presence-Sensing Device**

A **photoelectric presence-sensing device** uses a beam of light to detect the presence or absence of an object or person in a specified area. When the light beam is broken, the system activates a stop mechanism, halting the machine's cycle to prevent injury to the operator.

#### **Working Principle:**

- **Emitter:** A light source (usually infrared) emits a continuous beam.

- **Receiver:** A detector positioned at the other end of the light beam receives the light signal.
- **Detection:** If an object or person enters the beam's path and breaks the light, the receiver detects the interruption.
- **Action:** The control system then sends a signal to stop the machine, either before the hazardous action begins or during its operation.

#### Example of Application:

- **Industrial Press:** If the operator's hand enters the danger zone while the press is operating, the photoelectric sensor will detect the interruption of the light beam and stop the press, preventing potential injury.

## 2. Electromechanical Sensing Device

An **electromechanical sensing device** uses a probe or contact bar that descends to a specific distance during the machine cycle. If there is any obstruction that prevents the probe from completing its descent, the machine's cycle is not activated or is interrupted.

#### Working Principle:

- **Probe/Contact Bar:** The device has a movable probe or bar that descends to a predetermined position during the machine cycle.
- **Obstacle Detection:** If there is an obstruction (e.g., a person's hand or another object) that prevents the probe from descending fully, the control system detects this failure.
- **Machine Control:** The control circuit will prevent the machine cycle from initiating or will halt it if the obstruction is detected, ensuring the operator is not at risk.
- **During the cycle:** The probe begins its descent as part of the machine's normal operation.
- **When obstruction occurs:** If something obstructs the probe, it fails to descend completely, causing the machine to stop or preventing it from starting, protecting the operator from harm.

#### Example of Application:

- **Robotic Arm:** In an automated system where a robotic arm moves parts, an electromechanical sensing device can ensure that the arm does not operate if the operator's hand is in the path of the robot's movement, avoiding injury.

## Comparison of Photoelectric vs Electromechanical Presence-Sensing Devices

Feature	Photoelectric Sensing Device	Electromechanical Sensing Device
<b>Principle</b>	Light beam interruption	Physical obstruction detected by probe/contact bar
<b>Detection Method</b>	Optical (Infrared or laser)	Mechanical (Movement of probe)
<b>Application Area</b>	Ideal for detecting people entering a defined zone	Ideal for machines with moving parts or limited space
<b>Maintenance</b>	Generally low maintenance	May require more frequent checks due to mechanical parts
<b>Speed of Response</b>	High, with almost instant reaction to obstruction	Moderate, as it depends on mechanical movement
<b>Cost</b>	Generally more expensive	Relatively less expensive

### 16. Briefly explain the maintenance of chain slings.

#### 1. Routine Inspections

- A **thorough examination** should be conducted by a **competent person** at least once every **12 months**, or more frequently based on statutory regulations, the type of use, and the frequency of lifting operations.

- During inspections, look for:
  - **Bent links** or **cracks** in the chain links.
  - **Gouges** or other **damage** to the links.
  - **Deformation** of components such as **master links**, **hooks**, and any other fittings.

## 2. Wear Limits

- Chain and components should not show **wear exceeding 10%** of their original dimensions. Any components showing more than 10% wear should be replaced to maintain the integrity of the sling.

## 3. Overload Protection

- If a chain sling has been **overloaded**, it must be **removed from service** immediately. Overloading compromises the strength and safety of the sling.

## 4. Proper Storage

- Store **chain slings** on a **properly designed rack** to avoid damage.
- Avoid leaving slings on the **floor** where they may be subject to **mechanical damage** or **corrosion**.

## 5. Handling and Environmental Considerations

- **Alloy chain slings** should not be used in environments with **acidic** or **caustic** solutions, as the materials are susceptible to **hydrogen embrittlement** in such conditions.
- Chain slings must **never be heat-treated, galvanized, plated, or coated**, as these processes can damage the sling and **invalidate the manufacturer's certification**.

## 6. Temperature Range

- **Alloy chain slings** are suitable for use in temperatures ranging from **(-40°C to 200°C)** without affecting their **Working Load Limit (WLL)**.
- If the sling is exposed to temperatures exceeding this range, it should be immediately **withdrawn from service** for a **thorough examination** to assess potential damage.

## 17. Briefly explain the maintenance of clamps.

Clamps are essential tools used to secure objects tightly in place, either temporarily or permanently, to prevent movement or separation. Proper maintenance ensures their functionality, longevity, and the quality of the work performed. Here's how to maintain clamps:

### 1. Cleaning

- **Keep all parts clean** to maintain the efficiency of the clamp. Dirt, dust, and debris can interfere with its functionality and may stain or damage the surface of the workpiece during clamping.
- After each use, **wipe the clamp with a dry cloth** to remove any dust or particles that may have accumulated.

### 2. Lubrication

- **Oil all moving parts** regularly. This helps to prevent rust and keeps the clamp working smoothly, ensuring its components move freely.

### 3. Proper Storage

- Store clamps in a **safe and dry place** to protect them from environmental damage, such as rust or corrosion.
- A **shelf in a garage or work shed** is an ideal storage location, keeping them off the floor and away from potential damage.

## 18. What are the different types of machine guarding devices used in industries? Discuss the suitability of each.

### 1. Fixed Guards

- **Description:** These are permanent barriers attached to machinery to prevent contact with moving parts.
- **Suitability:** Best for machines with repetitive operations where adjustments are infrequent. Examples include guards for presses and conveyors.
- **Advantages:**
  - Simple, durable, and cost-effective.
  - Provides continuous protection.
- **Limitations:**

- Requires removal for maintenance, which can disrupt operations.

## 2. Interlocked Guards

- **Description:** These guards are connected to the machine's control system and stop operations when the guard is opened or removed.
- **Suitability:** Ideal for machines requiring regular access, such as for maintenance or cleaning.
- **Advantages:**
  - Prevents operation when the guard is not in place.
  - Enhances safety during maintenance.
- **Limitations:**
  - Complex installation and higher costs.
  - May malfunction if not properly maintained.

## 3. Adjustable Guards

- **Description:** Guards that can be repositioned to accommodate various sizes of materials being processed.
- **Suitability:** Suitable for machines like circular saws or grinders where flexibility is needed.
- **Advantages:**
  - Versatile and can handle diverse operations.
  - Allows visibility of the workpiece.
- **Limitations:**
  - May be less robust than fixed guards.
  - Requires user adjustment, increasing the risk of improper use.

## 4. Self-Adjusting Guards

- **Description:** These guards move automatically to expose only the section of the machine in use.
- **Suitability:** Commonly used on woodworking machines like saws.
- **Advantages:**
  - Requires minimal manual adjustment.
  - Provides dynamic protection.
- **Limitations:**

- Limited to specific types of operations.
- More complex and expensive.

## 5. Two-Hand Control Devices

- **Description:** These require the operator to use both hands to activate the machine, ensuring hands are away from danger zones.
- **Suitability:** Used for presses and stamping machines.
- **Advantages:**
  - Ensures operator hands are safe during operation.
  - Simple to use.
- **Limitations:**
  - May slow down operations.
  - Not suitable for tasks requiring a single-hand operation.

## 6. Presence-Sensing Devices

- **Description:** These include light curtains, pressure-sensitive mats, or photoelectric sensors that stop the machine when an obstruction is detected.
- **Suitability:** Best for high-speed operations or robotic systems where physical guards are impractical.
- **Advantages:**
  - Non-intrusive and allows for flexible operations.
  - Stops machines quickly in case of intrusion.
- **Limitations:**
  - Requires precise calibration and maintenance.
  - Expensive initial setup.

## 7. Pullback and Restraint Devices

- **Description:** These use cables or straps to physically restrain or pull back the operator's hands from the danger zone during machine operation.
- **Suitability:** Commonly used in mechanical presses.
- **Advantages:**
  - Effective in preventing hand injuries.

- Low maintenance requirements.
- **Limitations:**
  - Restricts operator movement.
  - Requires proper fit and adjustment.

## 8. Automatic and Semi-Automatic Feeding/Ejection Devices

- **Description:** These automate material handling, reducing operator interaction with danger zones.
- **Suitability:** Ideal for high-speed production lines.
- **Advantages:**
  - Reduces manual handling.
  - Improves productivity and safety.
- **Limitations:**
  - High installation costs.
  - Limited flexibility for custom jobs.

## 19. *Safety in turning, welding*

### Safety in Turning (Lathe Work)

Turning involves using a lathe to shape metal or wood, which requires careful handling. Here are some basic safety tips:

- **Secure the Material:** Always ensure the workpiece is properly secured in the chuck or vise before starting the lathe.
- **Check for Clearances:** Turn the lathe chuck by hand to make sure the material won't hit any part of the machine and the tool won't collide with the chuck.
- **Handle Wood Safely:** Do not use split or knotty wood as it can break during turning.
- **Support Long Pieces:** Use a tailstock to support longer, thinner materials to prevent bending or wobbling.
- **Use Correct Cutting Speed:** Larger or rougher materials should be turned at slower speeds to avoid accidents.

- **Stop the Lathe to Adjust:** Always stop the machine before making any adjustments or taking measurements.
- **Never Leave the Key in the Chuck:** Always remove the key after tightening or loosening the chuck to avoid accidents.
- **Turn Off After Use:** Make sure the machine is powered off and fully stopped before walking away.

## Safety in Gas Welding

Gas welding uses a flame from burning acetylene and oxygen, which can be dangerous if not handled correctly. Here's how to stay safe:

- **Wear Protective Gear:** Use goggles, gloves, flameproof clothing, and a welding helmet to protect against sparks and heat.
- **Proper Storage of Cylinders:** Gas cylinders should be securely stored in a vertical position, away from heat sources and flammable materials.
- **Check Equipment:** Ensure hoses and regulators are in good condition. Use flame arrestors to prevent gas from flowing backward into the hoses.
- **Handle Gases Safely:** Acetylene and oxygen should never be mixed or handled roughly. Always keep the valves closed when not in use.
- **Prevent Flashbacks:** Close the oxygen valve first, followed by the acetylene, if a backfire or flashback occurs.
- **Ventilation:** Always work in a well-ventilated area to avoid inhaling toxic fumes.

## Safety in Arc Welding

Arc welding uses electricity to join metals, which comes with its own set of risks. Follow these safety guidelines:

- **Proper Grounding:** Ensure the welding machine is properly grounded to prevent electrical shock.
- **Use a Helmet and Eye Protection:** Always wear a welding helmet with a special filter to protect your eyes from harmful rays.
- **Wear Protective Clothing:** Leather gloves, boots, aprons, and ear protection are necessary to protect against sparks, heat, and noise.
- **Avoid Wet Clothing:** Never weld with wet clothes as it increases the risk of electric shock.

- **Prevent Fumes:** Work in a well-ventilated area or use a respirator to avoid inhaling toxic welding fumes.
- **Monitor Equipment:** Do not overload the welding machine. If there are unusual sounds or malfunctions, stop and have the machine inspected.

By following these simple safety measures, you can significantly reduce the risk of injury while turning or welding.
